

# GitHub Setup

## Table of contents

Steps to setting up this GitHub Repository	2
1 Created a new repository on GitHub	2
2 Cloned to a local directory and set up repository as an R project	2
3 Prepared use of Quarto in the repository	2
4 Rendered html and pdf	2
5 Configured GitHub pages	2
6 Created a new chapter in the book	3
7 Protected the main branch and required all future changes to be submitted via pull requests	3
8 Prepare the repository to run python when engine is specified as jupyter	3
9 Set up a github action to automatically render the project's html and pdf files	3

## Steps to setting up this GitHub Repository

### 1 Created a new repository on GitHub

- a. Logged into GitHub and clicked on the “Create new...” icon
- b. Selected “New repository” and specified owner, name, and description
- c. Chose public visibility, turned on README, and added the R .gitignore template
- d. Clicked on Create new repository, then copied the repository URL

### 2 Cloned to a local directory and set up repository as an R project

- a. Cloned repository with RStudio to create an associated .Rproj file by navigating to File > New Project > Version Control > Git and then pasting the repository URL
- b. Staged, committed, and pushed the new .Rproj file

### 3 Prepared use of Quarto in the repository

- a. Added a new line for /.quarto/ to the .gitignore to ignore temporary files generated during the rendering process and remove the line that ignores docs/
- b. Created a simple \_quarto.yml and index.qmd files
- c. Staged, committed, and pushed the 2 new files and the changes to the .gitignore file

### 4 Rendered html and pdf

- a. Restarted RStudio for the Build tab to appear
- b. In the build tab, selected Render Book > All Formats
- c. Staged, committed, and pushed the new docs folder

### 5 Configured GitHub pages

- a. Navigated to Pages in the Repository settings on GitHub
- b. Selected and saved the main Branch and /docs folder as the source
- c. Refreshed the browser and copied the URL

## 6 Created a new chapter in the book

- a. Created a new quarto file called `github.qmd` in the R Studio project
- b. Added the name of the new GitHub quarto file to the `__quarto.yml` list of chapters
- c. In the build tab, selected Render Book > All Formats
- d. Staged, committed, and pushed the new `github.qmd` file along with the updated `/docs` and `__quarto.yml` file

## 7 Protected the main branch and required all future changes to be submitted via pull requests

- a. Configured required use of pull requests to prevent future merge conflicts by navigating to Settings > Branches > Add classic branch protection rule and then specifying the branch name pattern “main” along with selecting “Require a pull request before merging”

## 8 Prepare the repository to run python when engine is specified as jupyter

- a. Download python
- b. Set a Default Python Interpreter in RStudio
- c. Install Jupyter Kernel and the PyYAML via terminal: `pip install PyYAML`
- d. Install Jupyter Kernel via terminal: `pip install jupyter`
- e. Install libraries via terminal: `pip install numpy pandas matplotlib seaborn`
- f. Create a `test_python.qmd` file, include: `engine: jupyter`

## 9 Set up a github action to automatically render the project's html and pdf files
